

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

The company should use MFA, Firewall maintenance, and network access privileges.

Part 2: Explain your recommendations

Multifactor authentication would be a good recommendation because they would need other identification procedures other than the knowledge of other employees passwords or the admin password being set to default. I also recommend firewall maintenance because firewall rules can be used to filter incoming and outgoing network traffic and block unauthorized or potentially malicious traffic..
