

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	An organization's multimedia company was under a DOS attack this morning. A flood of ICMP packets sent to the organization's network caused it to stop working suddenly. The event management team blocked the rest of the ICMP requests and stopped all network service. An unconfigured firewall allowed the malicious actor to flood the network overwhelming the company through a Denial of Service attack. The security team implemented the NIST cybersecurity framework to help reduce the risks of attacks in the future.
Identify	Through investigation we found that there was a misconfigured firewall allowing the attacker to flood the network with ICMP packets. This weakness made the network vulnerable to the DOS attack.
Protect	The team has implemented measures to reduce any risk or threats to the network. There has been a new rule configured on the firewall to limit the number of ICMP requests coming in. Source IP address verification was also added to check for spoofed IP addresses.
Detect	The team has implemented an IDS/IPS to detect anomalies such as unusually high amounts of ICMP traffic. Lastly we have put in place a Network monitoring software to detect abnormal traffic.

Respond	The incident management team responded by blocking the incoming ICMP packets, shutting down non-critical network services , and restoring critical network services to limit the impact of the DoS attack.
Recover	The team restored critical network services and returned normal business operations after containing the attack.
